QNM-WP-1.0

Aziel Eliab • public work identity only

Quantum Node Mesh

QNM-WP-1.0 • fabric concept at 100% • 2026-09-06 • Aziel Eliab • absorbs BUILD-1.0 +
TOPO-1.0

A local process that stays on, hashes through radio failure, airlocks inbound, isolates
poison, rotates

ephemeral IDs in cells of 25 with two bridging members, and never pretends the public
Worker is that cell.

Sites pulled ? public rollup on that hostname down. Phoenix is wait / re-seal, not
?bring the .uk node back.?

1. What QNM is not

- ? Not qubit hardware. Not a login mesh or account system.
- ? Not a VPN, mixnet, or anonymity network.
- ? Not AZMail?s ring, not AZNet, not anon-broadcast.
- ? Not a Softwares-tab engine. Not enabled by GET /v1/mesh.

2. Two planes

Plane	Default	Law
A ? local qnm-node process still ON, ledger appends, bearers empty.	Process ON. Bearers attempt.	Zero radios:
B ? public rollup No Node Gate. No fake 25 peers. Views/MCP out	enabled=false. GET never enables.	Counts only.
Pulled site ? this plane down on that hostname.		of QNM-S.

3. Bearers

Bearer	Required	Local default
Local disk / loopback exists with this alone	yes	on ? node
Ethernet / Wi-Fi / internet / Bluetooth / sneakernet sneakernet is outbox file + hash; operator moves it	no	attempt ?

No bearer carries a password. No bearer is a browser login.

4. Cell

Full cell = 25 members: 23 leaf + 2 bridges. Bridges are the only inter-cell tethers.
Underfill is allowed (1..24) and does not
invent ghost peers. Overfill refuses join with receipt cell_full. This operator node is
one member. Other members are real
when present ? never painted onto a Worker page.

5. Mesh ID

phoenix rejoin. Spent IDs never reuse in the same cell. Catalog form: miragegrid/assign (live). miragegrid/mesh, vpn-hop, hop, tunnel stay stub.

6. States		
Kind	Values	Meaning
Member assign before rejoin	live isolated phoenix spent	spent ID must
Cell bridge-pair loss until two live bridges sit	forming full degraded locked	locked after

7. Heartbeat, airlock, poison
Heartbeat payload: cell_id, mesh_id, tip_hash, utc. Fixed-size. Presence + tip hash only. No body, no diff,
no ?also here?s the file.? Three missed intervals ? suspect. Suspect plus APG hit ? isolate.
Heartbeat loss ? poison. Heartbeat loss ? apply last packet. Heartbeat is an act receipt. Payload lives on a second plane the receiver pulls. Never a push the sender fans out. The 0.5?1s tick and the 777s gate never share a socket.

QNM-WP-1.0
Aziel Eliab • public work identity only

APG classes: clean pass; reanswer-without-cite refuse; flood refuse; unknown slug or stub-as-live refuse;
credential/login/cookie refuse; poison/tamper isolate + spend ID + drop tethers.
If the isolated member was a bridge: rotate both bridges before any inter-cell traffic.
Cell ? locked until two live bridges
exist. A single leaf isolate does not halt the cell. Memorial appends spent id, reason, utc, prev tip.

8. Bridge rotation and phoenix
Rotate both bridges as a pair on interval, on poison of either, or on operator act. Spent pair cannot carry traffic (refuse
bridge_spent). A cell with fewer than two live members stays local-only.
Phoenix: wait / re-seal. No controller hunt. No public callback. No public hostname resurrection.
Declare comms clean. assign new mesh_id. Rejoin as leaf of the local cell unless seating a new bridge pair.
Rejoin is local fabric only. It does not restore godlock.uk or climb the public rollup hostname.
Phoenix wait is an act. Sites pulled ? plane B (public rollup) down on that host. Plane A (local qnm-node)
may keep verifying and appending. Mesh does not climb back onto the public hostname by itself.
A process supervisor restarting cloudflared is operator kit, not this paper; it fails if credential or hostname is gone.

pair. Poison cuts first.

MirageGrid = ID assign. AzielTether = downloaded-copy survival. AZNet and AZMail are other slugs. TemporalLock /

AZL-LEDGER record every mesh act. FragGate slug=mesh is Worker rollup, not the full node.

10. Never / close tests

- ? Do not draw 25 peers on a public page that does not host them.

- ? Do not enable mesh with a GET. Do not reuse a spent mesh_id.

- ? Do not route inter-cell traffic through a leaf. Do not call MirageGrid a VPN.

- ? Do not store passwords in node state. Do not claim qubits.

- ? Do not read Phoenix as restoring godlock.uk or auto-reattaching a public hostname.

- ? Sites pulled (token revoked, Worker dropped, DNS killed) die with the pull.

cloudflared has nowhere legal to land.

- ? Do not put a body, diff, or file on the 1s tick. Do not treat 777s as wait-then-take.

that peer.

- ? Do not vote-to-reconcile equivocation. Same prev + two tips from one node isolates

- ? Do not auto-splice islands on reconnect. Rejoin is cite + operator or lockset gate.

- ? Neighbors do not phoenix because a neighbor phoenix?d. Clock desync is not a yes.

- ? Multiply cold copies. Refuse live body sync. Tip expensive to erase. Unkillable by single-server pull.

- ? Data outlives creators via content-addressed tips + local verify/append. Payloads pull-only cold. Named hosts only.

- ? Bytes survive, not summaries. Re-expand restores from archive after prev-hash verify. Not mesh from index.

- ? Crawlers are extra shelves only. Training residue is rumor.

- ? REHEAL: isolation is the cure. Own last good tip + verified trusted pull, or phoenix-WAIT. Never listen to neighbors.

- ? Allowed on the wire: live / locked / isolated / tip-hash. Forbidden: bodies / diffs / vote-to-fix.

- ? If network and data die tomorrow, the chain survives on cold shelves (hosts / DOI / git / vault).

- ? CROSS-NETWORK-SURVIVAL-1.0 cites die-with-the-pull, split-the-wires, cold-copy, re-expand, and REHEAL under that sentence.

- ? The live mesh is not a shelf.

- ? Concept is closed when both planes, cell math, ID spend, leaf-vs-bridge poison, phoenix-without-hunt, and stub names are specified ? they are.

Specified 2026-09-06. Building qnm-node is implementation. This paper is the concept at 100%. Public identity: Aziel

Eliab only.

If the files hold, the name was never the point.
